Hello User, on download free Pure Mathematics book at our.: Maximum utilization ([Figure 3](#f0003)(ref-type="fig")).Figure 3Maximum utilization of the six-month period (Max %) was set at 74%, with the blue line above the efficiency ceiling and the red line below it. To maintain 74% utilization, the mean daily energy requirements of 55 patients was 624 kcal (2070 KJ). Percentages indicate the daily number of patients with an energy requirement that was above or below the average of 624 kcal (2070 KJ). Discussion (#80004) ===== The idea of establishing means to evaluate the efficiency of a given ration is not new and is generally accepted.[@cit0006] Many studies have evaluated the average energy requirements of patients in a given population of patients.[@cit0007] defined energy requirements for optimal functioning.[@cit0008] or compared the energy requirements of healthy individuals with energy requirements of patients with acute illness.[@cit0009] This study is intended to evaluate the efficiency of a ration by evaluating its cost-benefit ratio (the ration's net effect in terms of cost and health). Dietary costs are the highest on-cost of providing the ration, and many patients (usually well-off patients) suffer from low energy and nutrient intake.[@cit0007] This shortage is reflected in the low energy consumption of the average patient that constitutes 1% of the total costs of hospitalization and is below the EU-recommended value (Table S1). The main purpose of the ration is to stimulate endogenous fat breakdown (releasing fatty acids from adipose tissue into the bloodstream) and to provide an appropriate amount of amino acids to help protein synthesis. The ration in this study helped to reduce the hospitalization period with a maximum of 7 days compared to the average of 11 days without the ration. The costs of each kcal of this ration constitute a cost of 0.22€ or a cost of 0.20 € in other countries. Table S2 shows how much each kcal costs according to the proposed ration and the costs per patient in other countries. The ration is successful in reducing the costs of hospitalization and has more than a 90% cost-benefit ratio, as the ration reduces the costs of hospitalization by 46.66% and the cost per patient with the ration is less
