Country India[India].Q: Read db files from a path and only allow server to read them I have a C# application that needs to be able to execute some SQL queries on a db in my project folder. The whole application is running on a server, and I want to make sure that the file is not to be read by anyone, and only available on the server. I've searched a while to find out if I can use SQLite in.NET to accomplish this task. I know I can do this for a shared directory by setting up the permissions, but I don't want to go that route. So here is my question: Is there a way to configure SQLite to open the files with specific permissions, so that I can just put them in a path? Thank you! A: The NET version of SQLite doesn't have the option to restrict access, the only version of SQLite that does have that feature is the unmanaged one. However, you can write your own parser for the file and implement your own permissions, that way the code can serve them to SQLite without needing access to any file system. It's not that difficult, here is a sample implementation from the C# version.
