An attempt was made to detect a rhythm in the proliferative activity of mammalian spermatogonia in a liquid culture. A new approach was used, namely a continuous counting of the population growth rate for each individual cell. Spermatogonia of the rat and pig from the stage of haploid cells, i.e. before meiotic prophase, and diploid and haploid spermatogonia from the stage of meiotic prophase, were studied. A marked difference in proliferation rate was found between the haploid rat cells before meiotic prophase and the other two groups. The rate of the diploid pig cells was the lowest. However, on an individual basis, these differences were never statistically significant, and the spermatogonia of all three groups had the same small variations in their proliferative activity. The most likely explanation for this is that at any individual level, the spermatogonia have a similar proliferative activity during their short, regular bursts of mitosis.Q: gnuplot: How to remove the red line on my chart? I am plotting the temperature changes in an area next to a lake. The blue line is the mean temperature during the last 2 years. The red line shows the difference in temperature between the last 2 years and the mean. I dont want to see the red line. How do i do this? My data starts in the time period 2009-10-13 11:00:00 to 2011-01-15 11:00:00. Here is my current chart: Here is a gif of what i get: This is my gnuplot file: reset # set title set term png set output "Legend.png" set xdata time set timefmt "%d-%m-%Y-%H:%M:%S" set style data linespoints set key right set key autot ba244e880a
