Registration Manager - This component allows you to easily register driver settings and add components to the driver. Common Storage Driver Template - This component allows you to create drivers that store their settings and components in a central location that can be accessed from multiple driver applications. Image Manager - This component enables the management of DLLs and source code that are needed for the drivers. Uninstall Manager -

Window Driver Foundation provides a number of other core components such as Installation, Uninstallation, Device-Templates, Driver-Template and Kernel Mode Driver. Installation - This component allows you to install and uninstall Windows Drivers with a single command. This component was developed based on the Windows Installer API. Uninstallation - This component allows you to uninstall Windows Drivers with a single command. This component was developed based on the Windows Installer API. Device-Template - This component allows you to define a driver's configuration for specific hardware.
